TTP is a rare blood condition characterised by the formation of small clots (thrombi) within the circulation, which results in the consumption of platelets and thus a low platelet count (thrombocytopenia).

TTP is a rare blood clotting disorder where small clots form throughout blood vessels causing damage to red blood cells which encourages more clotting. The initial clotting is caused by the inhibition of the ADAMTS 13 enzyme which is critical to breaking up blood clots together with the formation of antibodies which attack the enzyme.

Presenting symptoms of TTP can range from flu like symptoms and general tiredness. Other symptoms noticeable before diagnosis could manifest in form of bruising,

confusion,

anxiety,

headaches,

stomach upset,

feeling feverish,

blurred vision,

chest aches

stroke like signs.

Always make an appointment to see your GP if these symptoms present and persist for a blood test to check your heamoglobin and platelets levels.

What is TTP?

Thrombotic Thrombocytopenic Purpura

aofac FOUNDATION

Our Mission

To bring awareness to Thrombotic Thrombocytopenic Purpura (TTP) and provide support for people and families that are affected by TTP.

Raise funds to support Research into TTP

To keep Anthonia Oyindamola's memories live and work towards fulfilling her most cherished dreams and wishes.

Visit our website and facebook page to find out more about TTP and our work.
