This poster gives an overview of IEA Wind Task 36 for Wind Power Forecasting. The Operating Agent is Gregor Giebel of DTU, Co-Operating Agent is Will Shaw of PNNL. Collaboration in the task is solicited from everyone interested in the forecasting business. The second phase of Task 36 runs for three years, 2019-2021.

The main deliverables from phase 1 (2016-2018) were (1) an IEA Wind Recommended Practice on the forecast solution selection and evaluation process, (2) an up-to-date list of current wind forecasting projects and their main project results, including datasets which can be used by researchers around the world to improve their own models, and (3) two review journal papers regarding the use of probabilistic forecasts and minute-scale forecasting and one Power & Energy magazine publication. Through workshops, webinars and meetings, dissemination of relevant information in both forecaster and end-user communities has been a focus area. Participation is open for all organisations in member states of the IEA Annex on Wind Power, see ieawind.org for the up-to-date list.

Summary

This poster gives an overview of IEA Wind Task 36 for Wind Power Forecasting. The Operating Agent is Gregor Giebel of DTU, Co-Operating Agent is Will Shaw of PNNL. Collaboration in the task is solicited from everyone interested in the forecasting business. The second phase of Task 36 runs for three years, 2019-2021.

The main deliverables from phase 1 (2016-2018) were (1) an IEA Wind Recommended Practice on the forecast solution selection and evaluation process, (2) an up-to-date list of current wind forecasting projects and their main project results, including datasets which can be used by researchers around the world to improve their own models, and (3) two review journal papers regarding the use of probabilistic forecasts and minute-scale forecasting and one Power & Energy magazine publication. Through workshops, webinars and meetings, dissemination of relevant information in both forecaster and end-user communities has been a focus area. Participation is open for all organisations in member states of the IEA Annex on Wind Power, see ieawind.org for the up-to-date list.

Activities

News: Recommended Practice finalised and published!

NWP Improvements

This WP brings together global leaders in NWP models as applied to the wind industry to exchange information about future research areas. The emphasis is on improvements of the wind-related forecast performance of these models especially in typical rotor heights. Two lists of data have been kept up-to-date: tall mast and wind power forecasting experiments. Additionally, this WP verifies and validates the improvements through a common data set to test model results upon and discuss at IEA Task meetings.

RP Forecast Selection Process

In the second WP, a Recommended Practice (RP) guiding the selection process of forecasting solutions was developed:

The first part, the “Forecast Solution Selection Process” deals with the selection and background information necessary to collect and evaluate when developing or renewing a forecasting solution for the power market.

The second part “Benchmarks and Trials”, of the series offers recommendation on how to best conduct benchmarks and trials.

The third part “Forecast Evaluation”, provides information and guidelines regarding effective evaluation of forecasts within or outside of benchmarks and trials.

Use of Uncertainty Forecasting (WP3)

The third WP assessed the current use of forecast uncertainties by the power systems sector via a survey and documented the results in a report. This WP also provides outreach to forecast users via webinars and other means to enhance their knowledge and ability to use all available forecast information for operations.

Information Portal

A list with masts useful for validation of the forecasts is published, measuring at least 100m. The list currently contains more than a dozen masts on- and offshore.

A list of meteorological experiments going on currently or recently, either to participate or to verify a flow model against. For example the Perdigo experiment of the New European Wind Atlas or the Wind Forecast Improvement Program 2.

A list of current or finished research projects in the field of wind power forecasting.

Results

In June 2018, IEA Wind Task 32 Lidars and 36 Forecasting held a combined workshop on Very Short Term Forecasting of Wind Power. The main tools employed were lidars, radars and SCADA data. Main results were:

• Forecasts on the minute time scale are getting more important in high-wind-penetration power systems.

• A combination of weather models and instrumentation provide important information when persistence fails, namely at fast changing weather conditions, ramping and high speed wind events.

• Data quality is a major issue, including sensor availability (e.g. for Lidars).

Journal paper is published in Energies 2019: “Minute-Scale Forecasting of Wind Power – Results from the collaborative workshop of IEA Wind Task 32 and 36” (see above)

Phase II

The second phase of the Task adds new targets:

• Discussion of possible parts of the forecasting processes to be standardised in the future.

• Online verification and benchmarking of current NWP models with met mast data.

• Detailed review of uncertainty propagation through the modeling chain.

• Assessment of the value of probabilistic forecasts, both on a theoretical basis as well as through description of actual use cases and examples.

• Development of an IEA Recommended Practice for the requirements of data and instrumentation for real-time forecasting.
