14:00 - 14:15

Coffee break with Q&A

14:15 - 15:00

Round Table: more Q&A, discussion and feedback collection

15:00

Sales Ended

About this event

The Data Science Holodeck project and smart students from Cphbusiness invite you to an open session and a *heads-on* experience in artificial intelligence (AI) and virtual reality (VR) – two closely related technologies promising to change our way of perceiving the world forever.

Have you been touched by the recent ChatGPT hot hype. Do you feel attracted or you are already tired of it? Are you familiar with the good and bad sides of it? Should you be excited of applying it yourself or worried of being left behind? Do you still wonder what actually the modern AI technologies mean to you personally and your business, particularly?

Do you have experience in data-driven acceleration of the daily processes you are engaged with or you consider taking use of it, but would rather be able to see transparently through the options first? Could a knowledge graph unleash the hidden power of your data? Would you like to know more about the available knowledge-based technologies, the advantages they provide, the related challenges and the choices you can make?

This event is about involving you in searching for the answers of such questions, but also about revealing to you the spectacular opportunities the modern virtual worlds provide to enhancing our collective intelligence and experiences as personal and professional knowledge managers.

While involving all your human senses, we would try to give you away a beautiful sensational feeling and deep rational understanding of how the artificial alternatives work, so you could possibly leave us a bit more convinced and confident in taking proper AI and VR decisions as educator or business value *change* manager.

We are looking forward to opening the doors for you!
