- ▶ Import and export functions
- ▶ Prevent strangers from entering undetected
- ▶ Protect highly confidential information and valuable assets by restricting access
- ▶ Link to one monitoring system

PACOM Unison access control integration provides a secure means of restricting access to a building and protecting assets for different types of businesses.

The Unison Access Control Module offers support for an unlimited number of users, readers, and different types of card technology making it an ideal investment for growing organizations. It ensures flexibility as you can customize access permissions by restricting people, cordoning off an area or blocking an entry or exit for a certain period of time.

Linking access control with various sub-systems offers definitive advantages. For example, when integrated with the HR system, identity management is simplified. You can use the employee access and departure information for effective attendance recording. Further, by linking to an alarm system, an intrusion is easily detected and quickly notified. You could also connect to the appropriate cameras to capture images and display video footage on the user-friendly Unison interface. Video clips and images could be used for future reference.

PACOM Unison Access Control Integration builds on your security solution by eliminating the need for lock and key system to secure assets and restrict access, replacing it with a more sophisticated card and reader system.

PACOM Unison links access control to alarm, video, HR and PIAM systems to offer a unified, powerful, secure, automated building access control solution.

SUPPORTED INTEGRATIONS
