

TWIGA

International Water Control Room

TWIGA

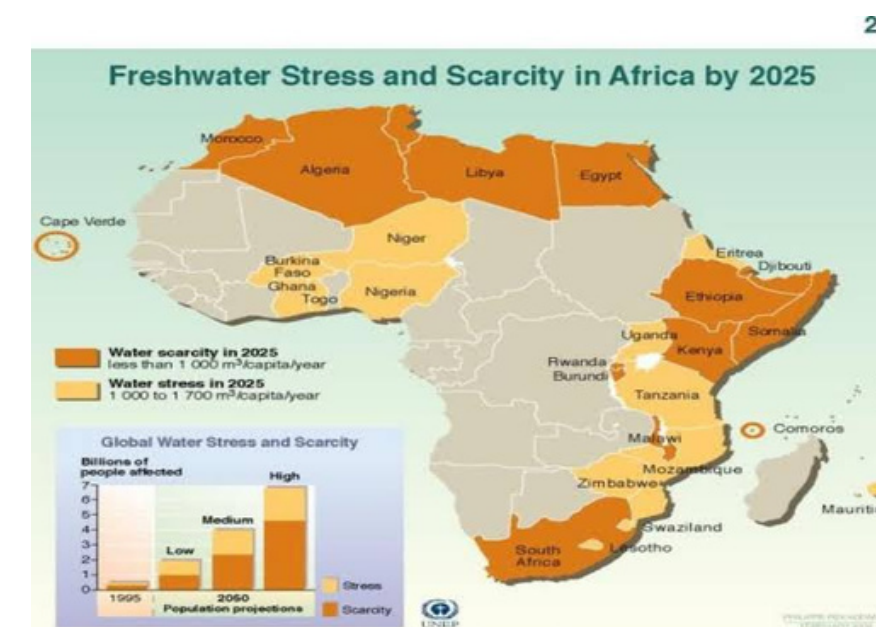

THE PROBLEM

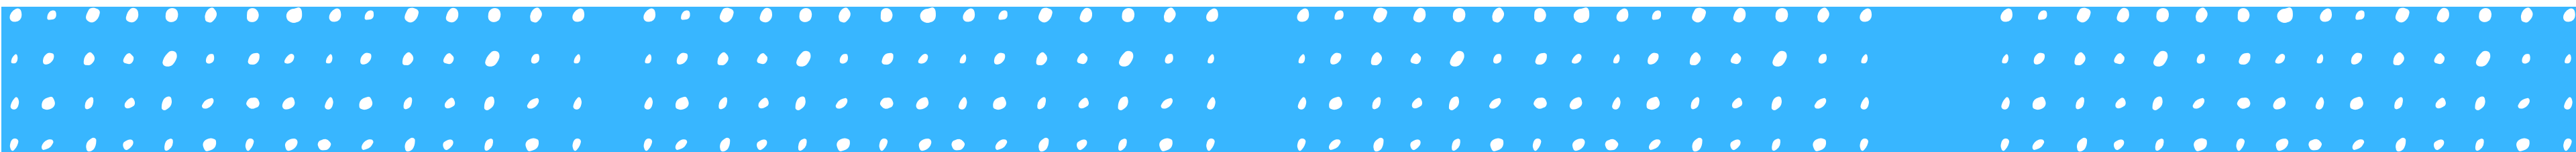

- Only 58% of Africans have access to safe drinking water

- Less than 5% of cultivated land in Africa is irrigated

Current fresh water distribution in Africa is expected to change rapidly due to climatic- and socioeconomic drivers (IPCC, 2014)

TWIGA

OUR SOLUTION

A water control room with shared weather and water related data in order to manage shared catchments. The service collects and gathers relevant data from the catchments to present the information in easy to understand maps and charts on the TWIGA platform.

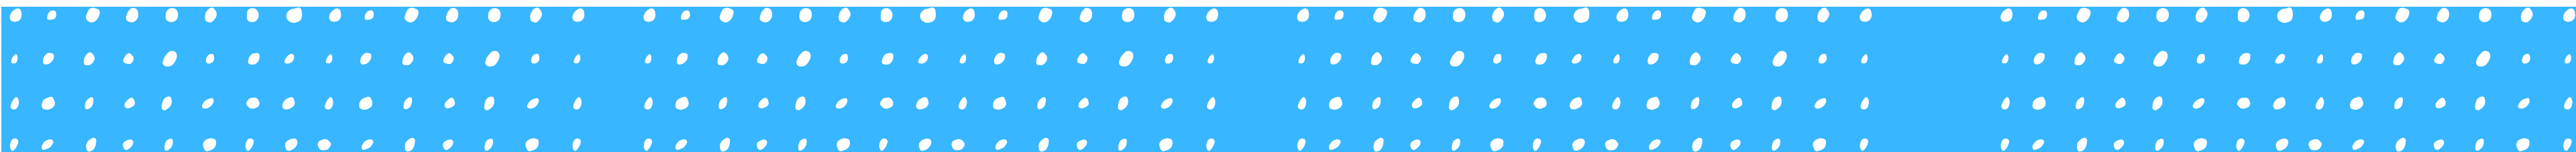

The service increases the efficiency of water use and provides knowledge to prevent unforeseen water scarcity. The easy accessibility of the data saves customers a lot of time that they would previously spend on collecting the relevant data.
