

# HOW HUMID IS MY ENVIRONMENT

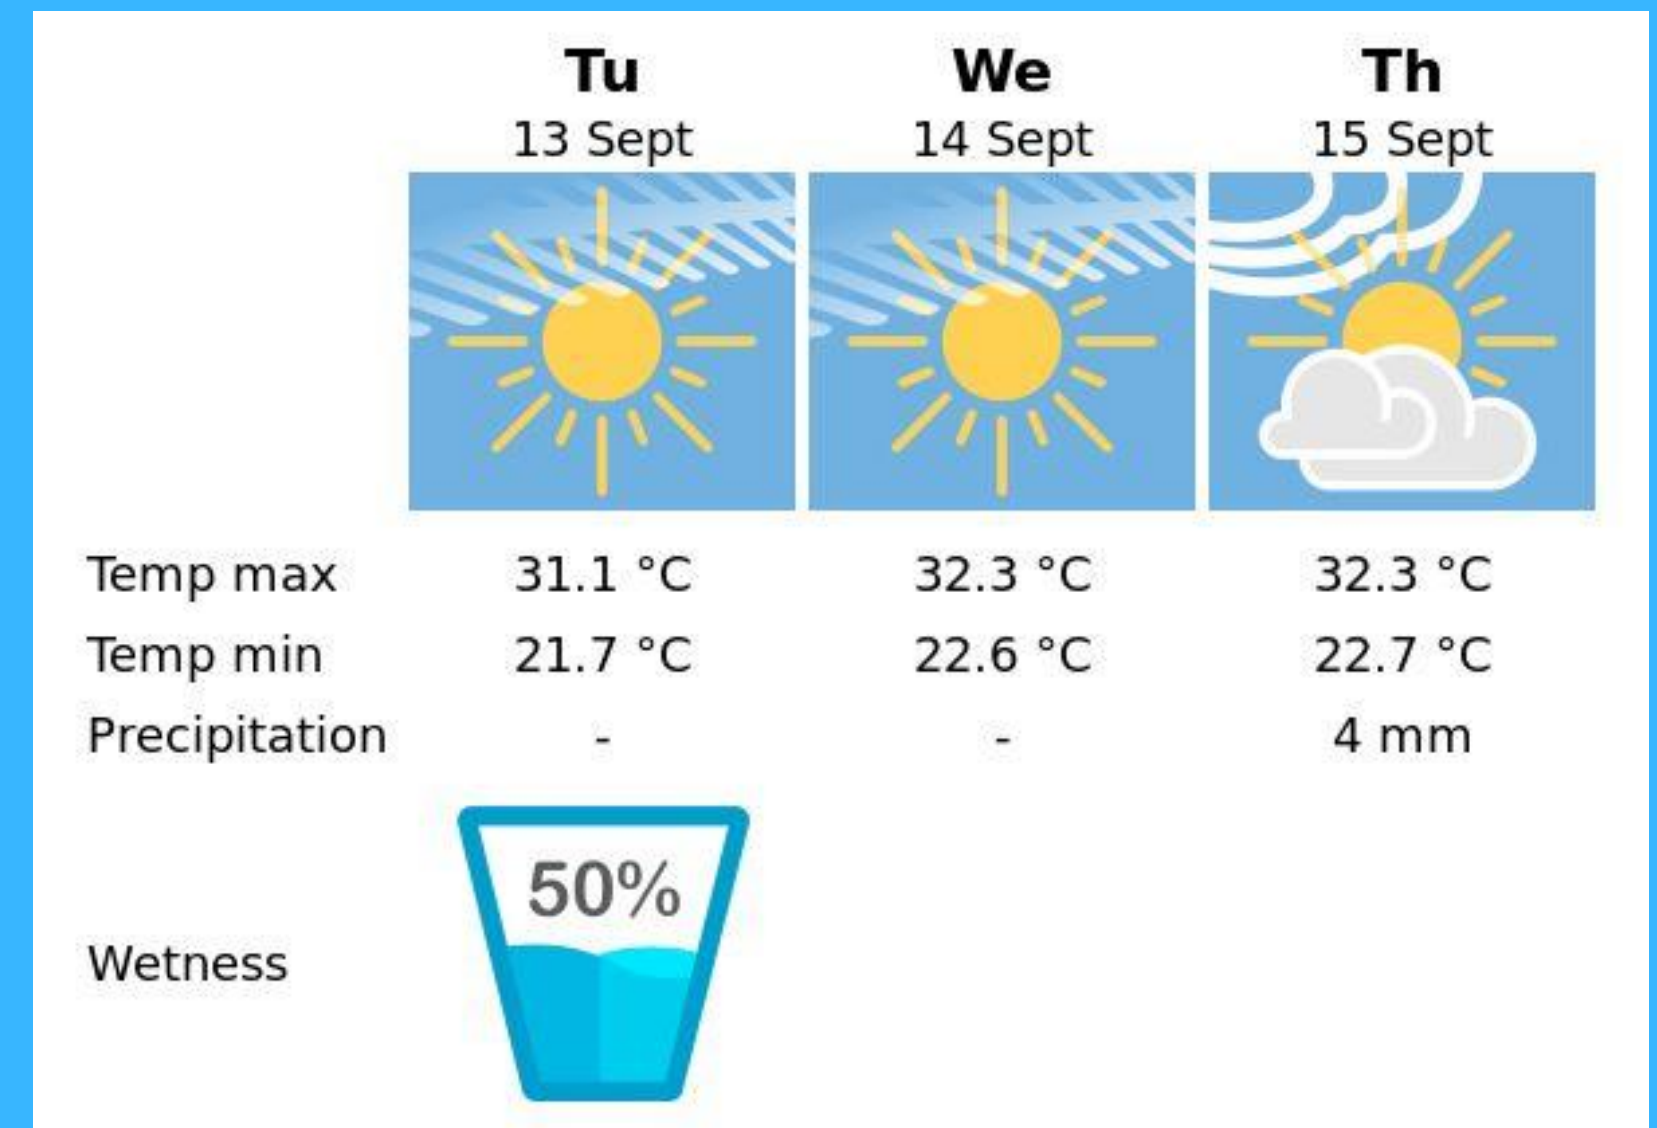

# ABOUT THIS SERVICE

This service provides farmers, or farm-input providers, with advice on when irrigation is needed and when spraying for certain diseases is needed.

This can be done by soil moisture sensors but when these are not available, standard meteorological measurements can be used to maintain a water balance of the root zone.

Advice is sent via a mobile application estimating how wet the soil is in four classes: Dry, Moist, Very moist, Saturated.

# WHY IS THIS SERVICE IMPORTANT

and black-pod disease in cocoa
