

## BIOCYCLIC VEGAN AGRICULTURE IS ...

... **Organic farming according to purely plant-based principles.** The Biocyclic Vegan Standard excludes animal husbandry for slaughter or other commercial purposes. No fertilisers or other inputs of animal origin are used. **To build sustainable soil fertility and plant health,** cycles are closed by purely plant-based methods. This is achieved with the help of **green manures, mulching, mixed cultivation** and by using **quality compost** and **Biocyclic Humus Soil.**

This benefits climate, soil and water, biodiversity, animals and, last but not least, humans!

**With the Biocyclic Vegan Quality Seal, products can be recognised on the market as “vegan from the field”.**
