3 July 2019

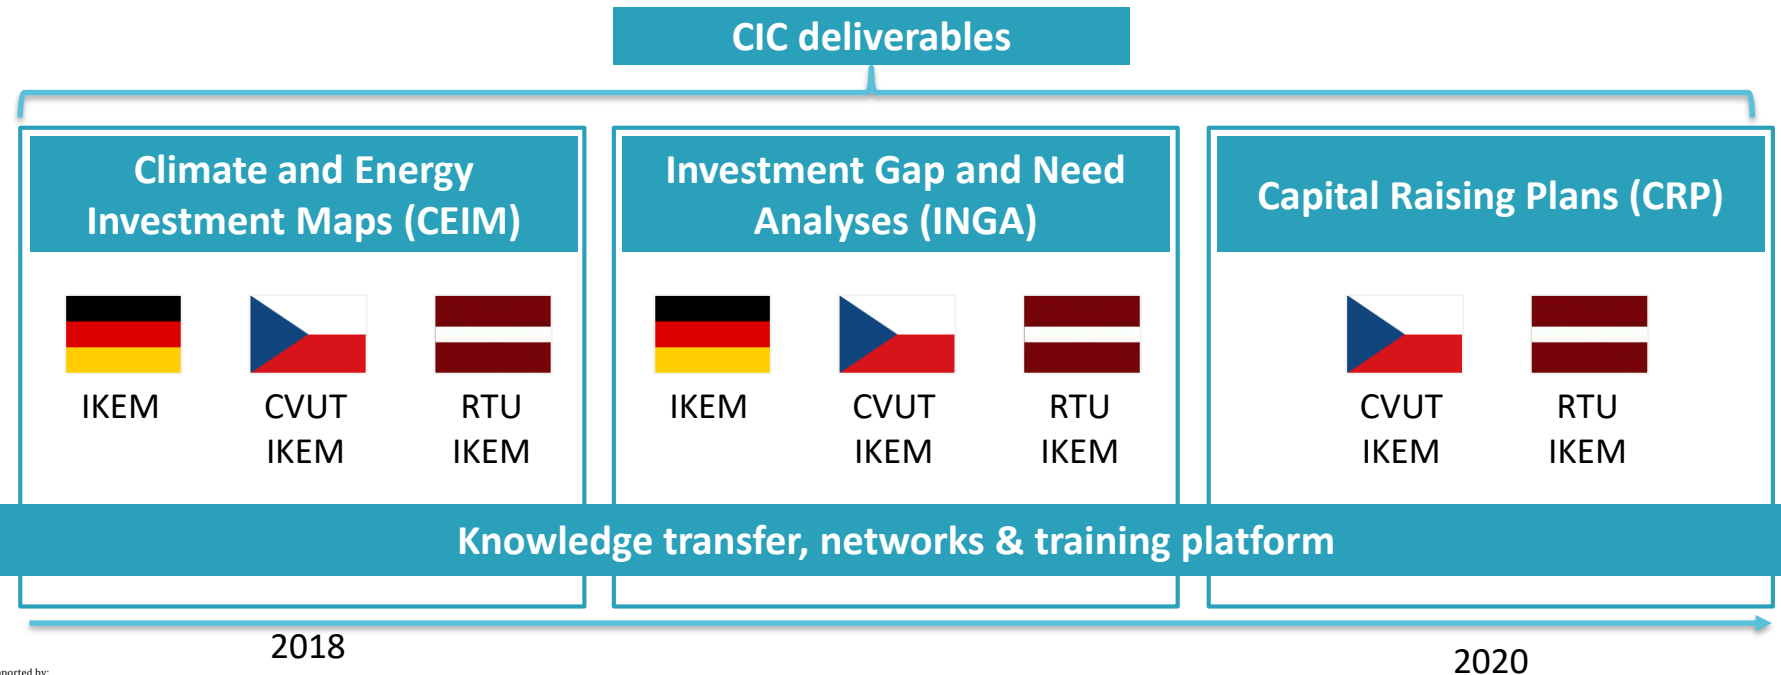

Assessment of current investment vs investment need. Lessons from Germany, Latvia and Czechia

*Slides are a part of the EUKI-funded project: Climate Investment Capacity
Aleksandra Novikova, PhD
Institute for Climate Protection, Energy and Mobility*

Project overview

Note: the project does not reflect the contents of
NECPs and/or commitment of the countries

Climate investment capacity (CIC): climate finance dynamics & structure for financing the 2030 targets

Supported by:

Energy and climate investment mapping

Methodology for investment maps

- ▶ The approach of tracking climate finance flows was introduced by CPI in 2011 to track these at the global level using the Landscape of Climate Finance diagram.
- ▶ Later, CPI-Berlin adopted the global approach into a framework suitable for analysing the national level and applied it to the case study of Germany for the year 2010.
- ▶ German map 2016 (ready), Czech map 2017 (IV-2019), Latvian map 2016 (IV-2019)
- ▶ The construction of the map uses a bottom-up approach tracking investment at a technology/measure level, aggregating it on sector level and then on country level.
- ▶ The map allows understanding who invests how much into what kind of measures and which intermediaries and financial instruments facilitate these flows.

DE Investment Map 2016, billion EUR

NON-GREY flows are **TOTAL TANGIBLE INVESTMENT (CAPital Expenditure)** incl public support into GHG reduction and increase of carbon sinks (thus, no guarantees, the cost of capital or debt repayment by investors, the compensation payments from the gov budget to suppliers of RE electricity under the feed-in tariff, etc.).

GREY flows are **INCREMENTAL INVESTMENT** into energy efficiency of buildings. The incremental figures are **STARRED IN BRACKETS**.

Gov budget covers federal budget disbursements + co-financing of EU funds (no public procurement, no admin costs, no regional and municipal budget, except when reported in the EU/federal budget, KfW, and BAFA programmes).

Lessons learned: advantages vs limitations

▶ Advantages:

- ▶ A visual snapshot of stakeholders, finance flows, and recipient
- ▶ Potential over- and underspending for further investigation
- ▶ Comparing countries' maps may help facilitate learning
- ▶ Comparing maps for different years may help understand the progress

▶ Limitations:

- ▶ A significant amount of input data
- ▶ The results do not permit to assess directly
 - The impact or effectiveness of policies and actions
 - Leverage of private money by public finance
 - Gaps to reach climate targets

Supported by:

IKEM

Lessons learned: Scope and boundaries

- ▶ Temporal scope:
 - ▶ Year which the latest data is available -> **2 year-lag**
- ▶ Measures:
 - ▶ Climate-specific investment vs. climate-related - > **related is a challenge**
- ▶ Investment scope:
 - ▶ Tangible vs. intangible investment -> **no tangible wt intangible**
- ▶ Cost definition:
 - ▶ Incremental vs. total capital investment – > **incremental is a challenge**

IKEM

Lessons learned from DE, LV, and CZ

- ▶ Need for definitions and methodologies
 - ▶ what is climate finance, how and to what extent climate-related measures should be accounted for (e.g. infrastructure), how to calculate incremental costs (e.g. buildings)
- ▶ Need for systematic tracking procedures that covers federal, regional, and local government budgets and climate programmes by public banks and agencies
 - ▶ e.g. climate tagging in public budgets, the establishment of annual evaluation procedures
- ▶ Need for evaluating and streamlining existing private-sector surveys and reporting efforts with the government's climate-investment tracking approaches
 - ▶ the private sector is the largest investor, but little understanding how much it invests

Investment need and gap assessment

Preliminary lessons learned from DE

Source: Juergens and Rusnok 2019

ID	Study	Investment need per annum		Reference
		Min. Bn €	Max. Bn €	
	Authors	Min. Bn €	Max. Bn €	GHG reduction
2050 – 80 % targets				
1	<u>DENA</u>	+33.3	+54.6	-62%
2	<u>BCG</u>	+28.6		-61%
3	<u>Fraunhofer-ISE</u>	+24.9	+38.4	Not stated
2050 – 90/95% targets				
1	<u>DENA</u>	+34.3	+58.3	-62%
2	<u>BCG</u>	+50.6		-61%
3	<u>Fraunhofer-ISE</u>	+49.6		Not stated
2030 – 55% targets				
4	<u>Prognos</u>	+20.0.	+22.5	-35%

- ▶ Results differ between assessments
 - ▶ E.g. for a -80% GHG target in 2050, the investment need ranges between EUR 24.9 and 54.6 billion

- ▶ Variations due to
 - ▶ E.g. baseline, technology price, energy price, discount rate

Supported by:

Preliminary lessons learned

- ▶ **Bottom-up studies are the most powerful (in terms of understanding details)**
 - ▶ Need to pay attention to assumptions
- ▶ **Methodology for LV and CZ (brainstorming in progress, results at the end 2019)**
 - ▶ The presentation of investment need using a similar framework as the investment map
- ▶ **Challenges of comparing the current investment to investment needs**
 - ▶ Different cost concepts and definitions
 - ▶ Assessment need studies assume: a) optimal tech mix, and b) lowest tech cost
 - ▶ The real world does not reflect the perfect/optimal/lowest-cost situation-> real investment will have to be higher

Capital raising plans

Preliminary lessons learned (start in III-2019)

- ▶ Little detail on how to finance required investment in submitted NECPs across all Member States
- ▶ Need to compare CRPs across MS and provide lessons learned from the most effective instruments
- ▶ Message from the mapping exercise : the private sector is the main investor -> need to create framework conditions for the private sector to invest
- ▶ Methodology to come in IV-2019, results in IV-2020
