NEXUS IB10 Principle

The Nexus IB10 immunochemistry system combines chemistry with microfluidics and centrifugal flow to rapidly prepare a cell free plasma from whole blood that can then be moved through a channel to rehydrate, solubilize and mix with freeze dried immunoconjugates. Using a combination of active flow and capillary action, the test sample is quantitatively measured in 20 minutes with an optical signal level proportional to the analyte(s) concentration.

After addition of the patient sample, the entire test is performed within the Nexus IB10 Analyzer, which provides control of the temperature of the disc, as well as the reaction sequence, centrifugal flow, mixing, incubation time, final signal measurement, quantitation and reporting of results.
