Microneedling & Electroporation

*Microneedling
Electroporation can
help to improve a
variety of different
indications such as
open pores, scars,
wrinkles, skin laxity and
uneven skin texture.*

- Restores, regenerates & repairs, for younger looking skin
- Face & body treatments available
- Suitable for all skin types & colours
- Fast treatment times

How does Microneedling Electroporation work?

Ultra fine needles penetrate the skin at different depths, creating micro-channels which stimulate a wound healing response leading to the production of new collagen and elastin.

Once the micro-channels have been created, the electroporation technology releases electro-stimulating pulses to increase the permeability of the skin cell membrane. This allows for increased absorption of serums applied to the skin, for hydrated, healthy skin.

Microneedling combined with electroporation significantly increases the amount of serum delivered within the skin compared with traditional Microneedling treatments.

Can Microneedling Electroporation be used on patients of all ages?

Yes, younger skins that don't yet require lifting and tightening can benefit from Microneedling Electroporation. Treatments can focus on specific concerns such as enlarged pores, or uneven skin texture to improve

the overall skin quality.

Patients with laxity concerns can benefit from the dual effect of Microneedling Electroporation. As the EPN Pen offers many different needle depths and intensity settings for electroporation, treatments can be easily customised to every different skin and the level of concern.

How does the treatment feel?

During the treatment there is generally minimal discomfort.

Topical anaesthetics are available for clients with sensitive skin should they wish to apply it prior to the treatment.

Skin *Rejuvenation*

Regenerate, restore and repair lacklustre skin by supercharging collagen. This reduces the appearance of wrinkles, fine lines and large pores and improves the overall texture of your skin.

- Smooths wrinkles & fine lines
- Boosts collagen to lift & tighten the skin
- Restores, regenerates & repairs, for younger looking skin
- Brightens dull skin

What benefits does Microneedling Electroporation have for your skin?

Microneedling Electroporation has a number of benefits for your skin. The main aim of the treatment is to generate collagen so your skin feels tighter, smoother and softer. After treatment you will see a smoothing of visible fine lines and a reduction in the appearance of pores for fresh, bright, tight and hydrated skin.

How does Microneedling Electroporation work for Skin Rejuvenation?

The treatment employs tiny medical-grade needles to create micro-channels that stimulate the production of collagen and elastin.

Once the micro-channels have been created, the electroporation technology helps to increase the permeability of the skin cell membrane. This means the serums applied during treatment will be introduced into the deeper layers of the skin for faster, more effective results.

How many sessions will I need?

Results can be seen after one session but, a minimum of 3 and

up to 6 treatments, at 4-week intervals, deliver the best results depending on the skin concern.

What results should I expect?

Most patients see an improvement in the appearance, texture and tightness of the skin 2 to 3 weeks after the first treatment. Best thing yet, your results continue to improve up to 12 weeks after the final treatment.

Will there be downtime?

There is virtually no downtime. A slight swelling and redness are present immediately post-treatment but should subside quickly.

Skin Laxity

Sagging, lax and wrinkled skin can be revitalised and rejuvenated by using Microneedling and Electroporation.

- Reduces sagging skin around the eyes
- Tightens crêpey skin on the neck, chest, hands & body from the inside out
- Lifts, & tightens the skin
- Smooths wrinkles

What benefits does Microneedling Electroporation have for skin laxity?

Improvements in skin laxity are achieved through increasing collagen and elastin production, for smoother, tighter and more lifted skin.

How does Microneedling Electroporation work for skin laxity?

Ultra fine needles penetrate the skin at different depths and release electro-stimulating pulses, stimulating a wound healing response leading to the production of collagen and elastin.

How many sessions will I need?

Results can be seen after one session but, a minimum of 3 and up to 6 treatments, at 4-week intervals, deliver the best results depending on the skin concern.

What results should I expect?

Most patients see an improvement 2 to 3 weeks after the first treatment. Results are natural but significant and get better over time, peaking at 12 weeks following the final treatment.

Will there be downtime?

There is virtually no downtime. A slight swelling and redness are present immediately post-treatment but should subside quickly.

Scarring and Stretch Marks

*Microneedling
Electroporation
stimulates the repair
processes for scarring
by immediately
boosting the production
of collagen. The result?
Plumper and more
even skin texture.*

- Smooths scars
- Improves skin tone
- Improves skin texture
- Improve the appearance of stretch marks

What benefits does Microneedling Electroporation have for scarring and stretch marks?

Scarring and stretch marks are very common concerns. The process of microneedling electroporation helps the body produce new collagen and elastin, which will reduce fine lines, smooth out uneven textures, and reduce any discolouration for acne scars, surgical scars, traumatic scars and stretch marks. The electroporation technology, when used alongside advanced serums, will re-hydrate the area of concern.

How does Microneedling Electroporation work for scars and stretch marks?

Ultra fine needles penetrate the skin at different depths and releasing electro-stimulating pulses in a controlled manner, stimulating a wound healing response leading to the production of collagen and elastin. The wounds cause trauma in the skin and trigger the body's natural response of creating more collagen and elastin to heal the facial or body scars and stretch marks.

How many sessions will I need?

Results can be seen after one session but, a minimum of 3 and up to 8 treatments, at 4-week intervals, deliver the best results depending on the skin concern.

What results to expect?

Most patients see an improvement 2 to 3 weeks after the first treatment. Results are natural but significant and get better over time. Your results will peak at 12 weeks following the final course of treatment.

Will there be downtime?

There is virtually no downtime. A slight swelling and redness are present immediately post-treatment but should subside quickly.

Hair Regrowth

*Revitalise hair follicles
and stimulate blood
circulation to increase
the thickness and
fullness of hair.*

Supercharged ingredients
needed into hair follicles:

- 3 growth factors
- 12 vitamins
- 24 amino acids
- 5 minerals
- 4 Coenzymes

What benefits does Microneedling Electroporation have for hair regrowth?

Microneedling Electroporation utilises a HD Celluma Serum to infuse the scalp with growth factors and skin proteins and vitamins designed to nourish and stimulate the scalp and hair follicles. This treatment is designed to stimulate, nourish, and hydrate the scalp for fuller and healthier-looking hair.

How does Microneedling Electroporation work for Skin Rejuvenation?

To begin the treatment the HD Celluma Serum is applied to the scalp. EPN employs tiny medical-grade needles to create micro-channels that pierce the scalp, pushing nourishing hair proteins directly into the hair follicles. This helps to produce more collagen and new skin cells to strengthen the hair follicles. You will see an improved appearance of the thickness and fullness of your hair.

How many sessions will I need?

A minimum of 6 and up to 16 treatments, at weekly intervals, deliver the best results.

What results should I expect?

Most patients see an improvement 4 weeks after the first treatment. Results are natural but get better over time. Your results will peak at 12 weeks following the final course of treatment.

Will there be downtime?

There is virtually no downtime. A slight swelling and redness is present immediately post-treatment but should subside quickly.

Targeted Treatments

Hair regrowth

Smooth acne and surgical
scars

Tighten lax skin on the face
neck, chest, hands and body

Shrink large pores and
improve an uneven skin tone
and uneven skin texture

Smooth fine lines and wrinkles

Reduce stretch marks
