

Nor-Guard OV11 and stress

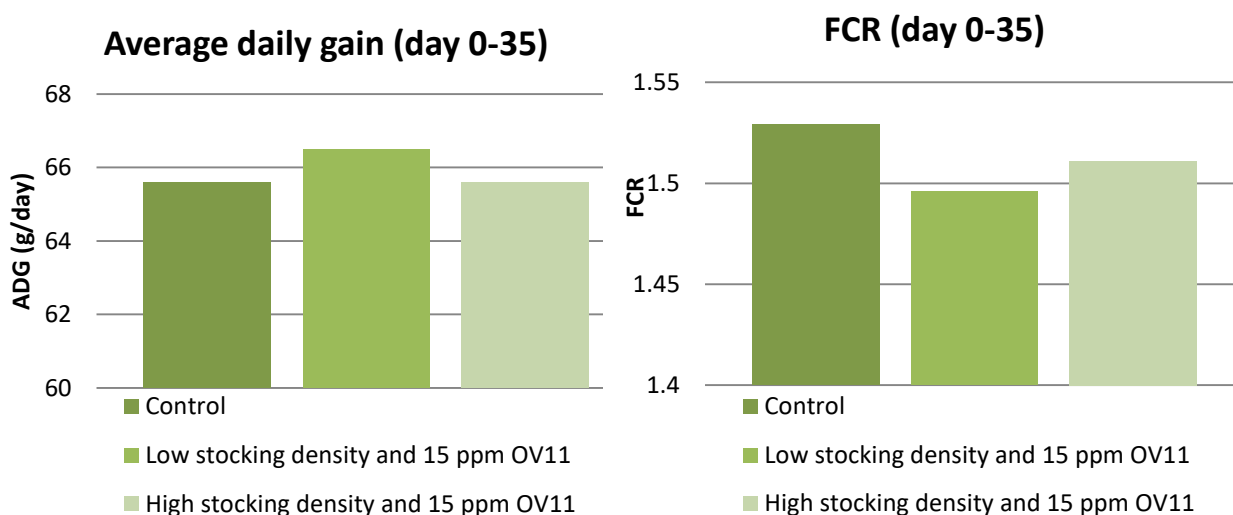

A recent trial at a professional trial-facility has shown that inclusion of **Nor-Guard OV11** in feeds for broilers can neutralizes the effect of high-density stress.

The inclusion of 15 ppm **Nor-Guard OV11** at a 23% higher stocking density resulted in a daily live weight gain that was similar to the one in the control group with a “normal” stocking density and even causing a more efficient feed conversion ratio.

The inclusion of 15 ppm **Nor-Guard OV11** at a “normal” stocking rate resulted in a higher daily live weight gain as well as a more efficient feed conversion ratio.

All the broilers were exposed to heat-stress during the trial period.

The trial shows that **Nor-Guard OV11** can neutralize the effects of high-stocking density stress.

Details of the trial are available upon request.
