Confetti mounting instructions

CONFETTI

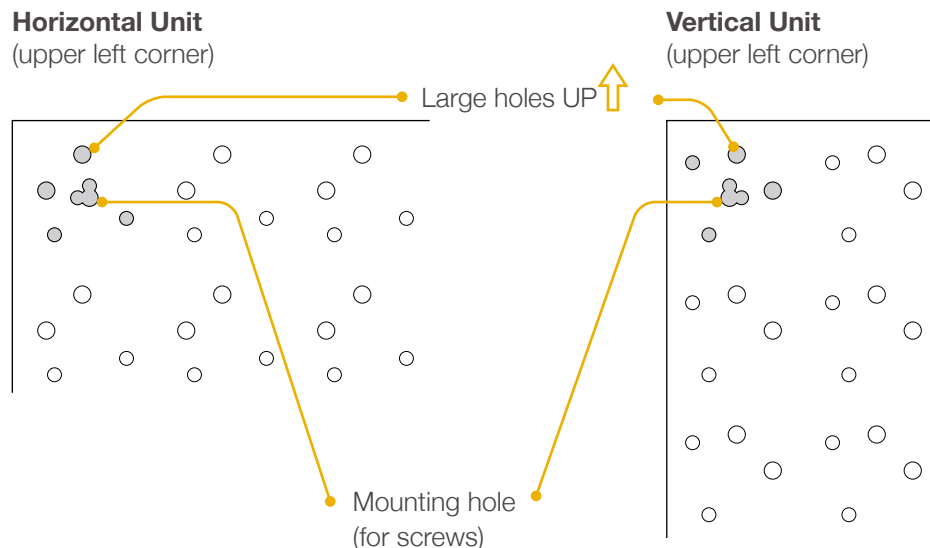

MOUNTING INSTRUCTIONS

Observe that depending on wall and load it could be necessary with more than two screws to mount the shelf to the wall.
Use screws adapted to the wall, typical dimension is 5x60mm.

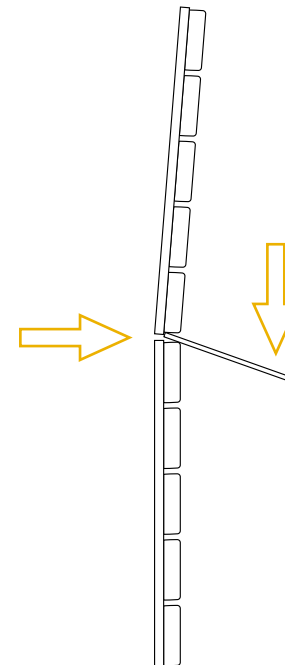

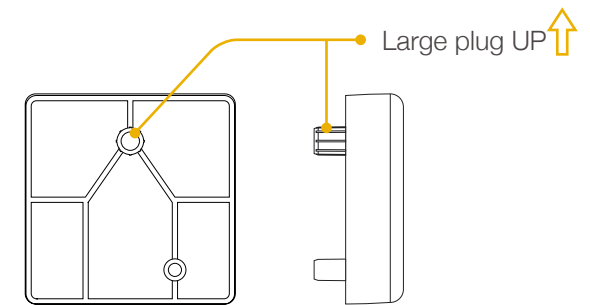

One unit can bear max 24kg, the short shelves 3kg and the long 6kg.

If two or more units are put together it's advised to mount them in vertical position to minimize the horizontal joints between the units.
Reminder: if several units are put on top of each other, make sure they can't move vertically by securing them.

! Make sure you turned the backplate correctly before you start placing the bricks:

! The bricks also has an top/bottom side, makes sure to turn them right: turn the bricks accordingly to your plan!

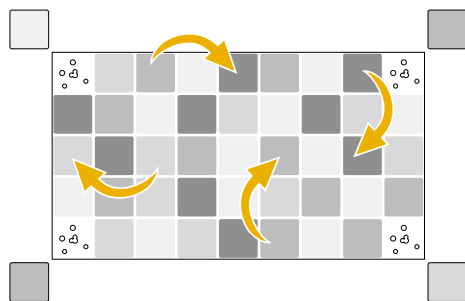

! Do not put shelves between units without secure the backplate to the wall rather than just hang it: it will push the units apart!

Highly customisable!

CONFETTI MOUNTING INSTRUCTIONS

Arrange the bricks.

Leave the two (or four) bricks in the corners for easier mounting to the wall.

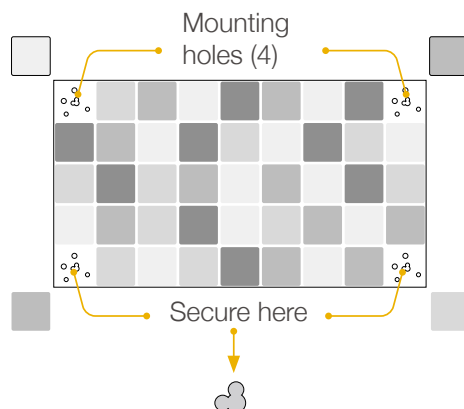

Lightly push the bricks in to the holes.

Use the foam in the package to protect the bricks and push firm or gently “walk” them in to place!

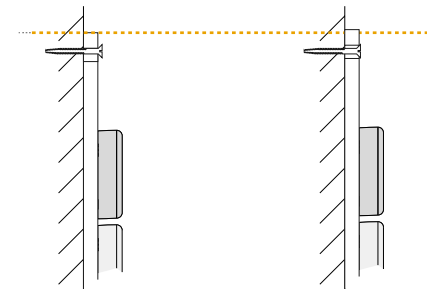

Use the mounting holes and mount the shelf on the wall with two (or four) screws. Depending on the type of wall it might be necessary with further securing.

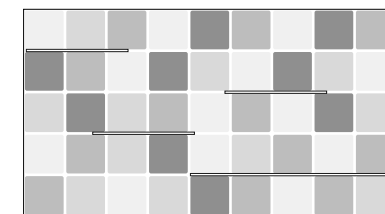

Tip!

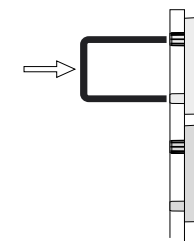

Depending on screw, it's possible to fine tune the level with the screw head.

Push the remaining bricks in to place and place the shelves. Sometimes some shelves can be a bit tight to place: It's easier to start with one of the corners when pushing them in.

For changing the bricks or remaking the pattern use the tool in the package. If another tool is used (screwdriver or such) use it in the large plug!

Not just another brick on the wall
