

Macro-segregations and their role in distortions in case-hardened ring gears

Emil Stålnacke

Researcher, Swerim AB, emil.stalnacke@swerim.se

SHTE Conference, Eskilstuna, Sweden: 2024-11-06

Macro-segregations and their role in distortions in case-hardened ring gears

Projektinfo

- Project leader: Emil Stålnacke, Swerim
- Contact: emil.stalnacke@swerim.se
- Project support: Rachel Petterson, Jernkontoret
- Time: 2020-10-28 to 2023-10-31

Macro-segregations and their role in distortions in case-hardened ring gears

What is a distortion

- Dimension change +
Shape change

Mechanisms behind distortions

Steel and heat treatment - a handbook, Ch 10

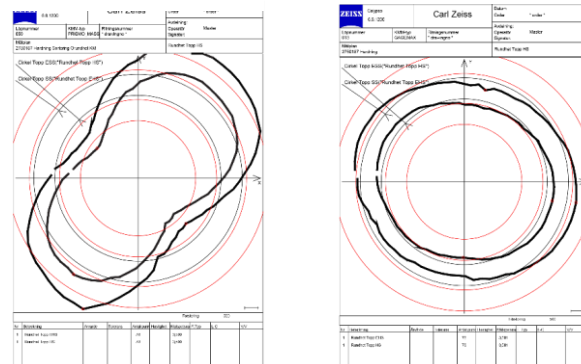

Hardening-induced distortions

Project component

- Ring gear
- 20NiCrMoS2-2
- 4 kg
- Outer diameter : 270 mm
- Inner diameter: 226 mm
- Height 49 mm

Visualization

Challenge

Macro segregations

Casting process

- Differential chemical composition between core and periphery of material – macro-segregation

Foto: Pia & Hans Nordlander-Bildn

Excentric macro-segregations

- What is the influence of this

- 4 a melt flow patterns and b mass fraction distributions of solute element C at strand cross-sections with different distances from meniscus

H. Sun & L. Li (2015) Formation and control of macrosegregation for round bloom continuous casting, *Ironmaking & Steelmaking*, 42:9, 683-688, DOI: 10.1179/1743281215Y.0000000018

Project goals

For the project: _____

- To quantify the influence of excentric macro-segregations on distorsions in ring gears
- To investigate how starting position of macro-segregations influence their final position in the ring gear

Long term: _____

- To attain knowledge to specify incoming material so distorsions become more predictable

Material for distortions

	C	Si	Mn	P	S	Cr	Ni	Mo
Comp	0.22	0.26	0.86	0.007	0.011	0.58	0.45	0.18
Min	0.19	0.2	0.7	-	0.008	0.4	0.4	0.15
Max	0.23	0.35	0.9	0.015	0.015	0.6	0.7	0.25

Ingot casting

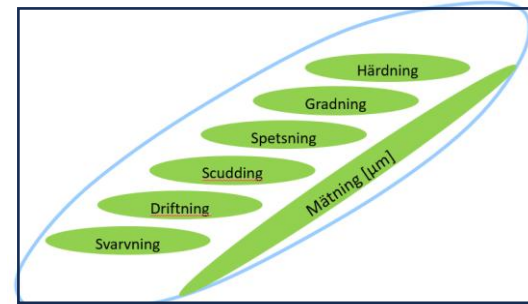

Bar rolling and machining smaller bars

Forging / Hot rolling

Gear soft machining and heat

Material for verifying simulations

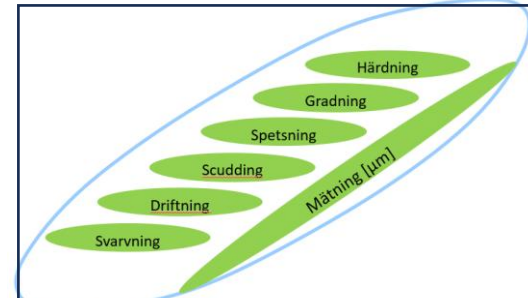

”Artificial” macro-segregation

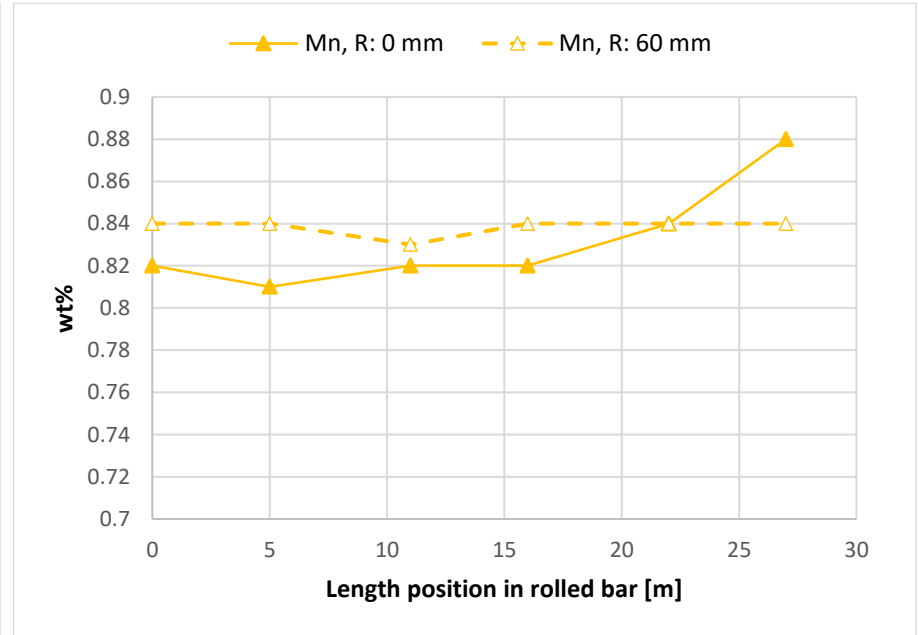

Forging / Hot rolling

Gear soft machining and heat

Material for distortions

Material for distortions

Location	Composition (vikts%)						Ms
	C	Mn	Ni	Cr	Mo	Si	Andrews Linear
R:60; L:0	0.22	0.85	0.48	0.57	0.18	0.27	403
R:0; L:27	0.27	0.87	0.48	0.57	0.18	0.27	382
R:0; L:0	0.18	0.82	0.48	0.57	0.18	0.27	421

Not a large difference in Ms!

Material for simulations

After HIP

Simulation setup

Starting material

Center

Excentric

15 mm
offset

Large Steel bar: $\text{\O}120$ mm

Small bar: $\text{\O}30$ mm

Forging simulation

Hot pressing

Hollowing

Ring rolling

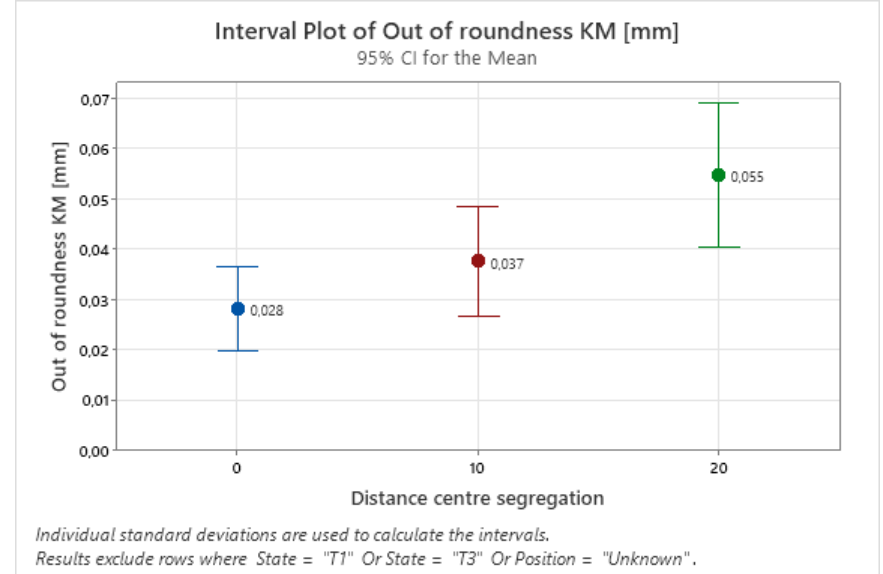

- Simulation software: FORGE NxT 4.0
- Material database: 100Cr6, with Hans-Spittel Material Model

(Tool geometries from CAD-files)

Results

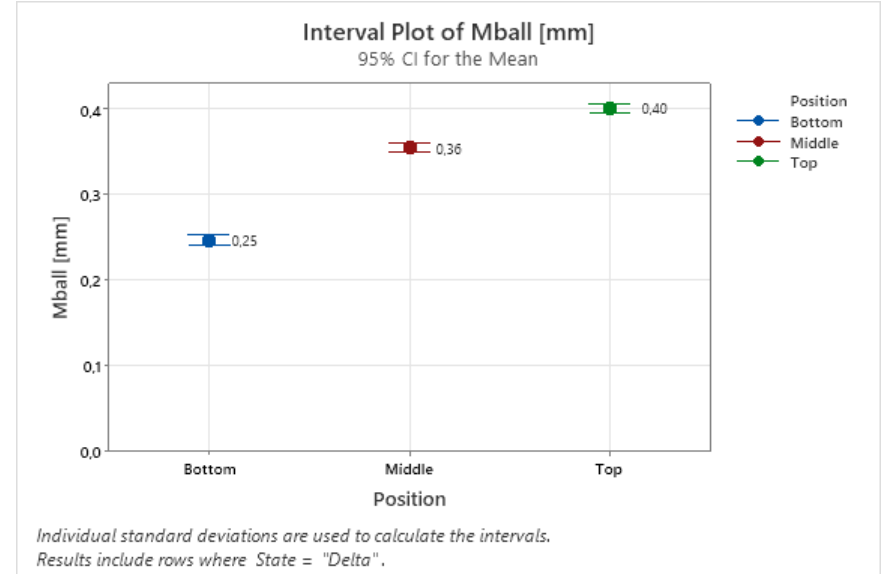

Out of roundness analysis

Conicity

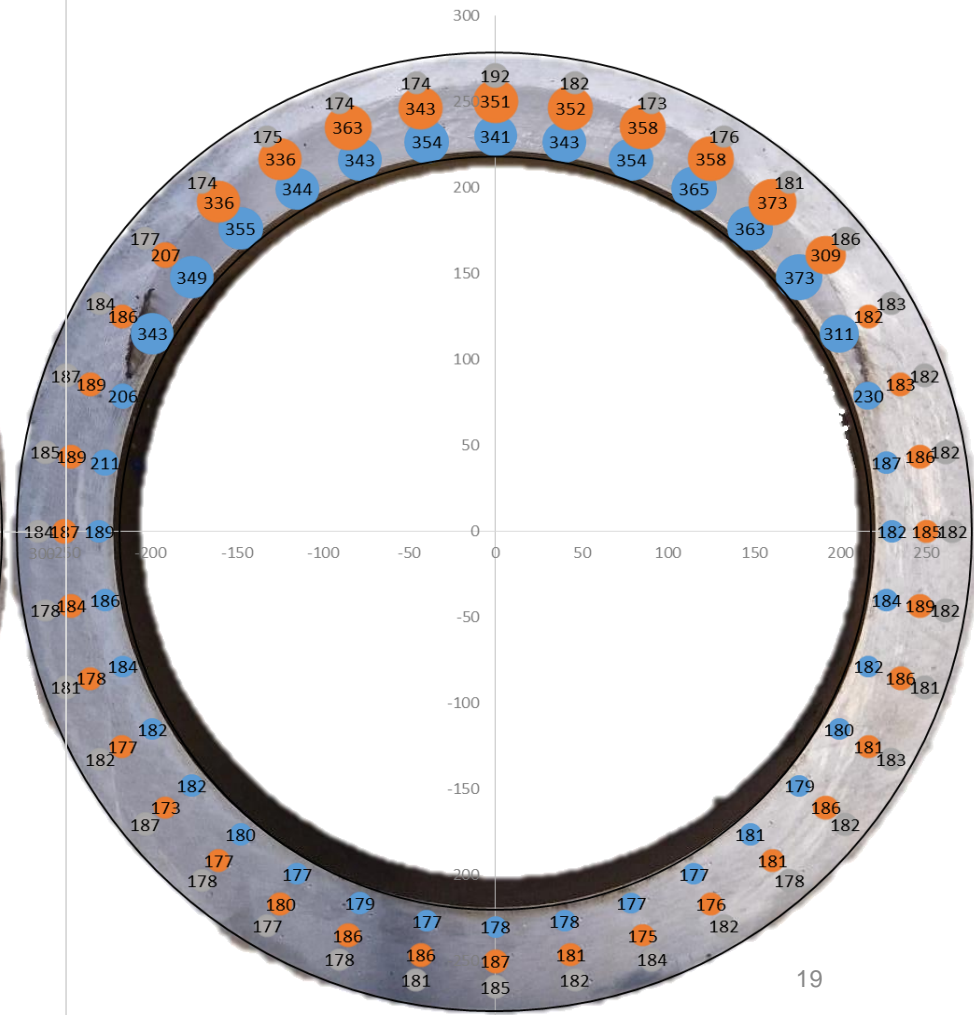

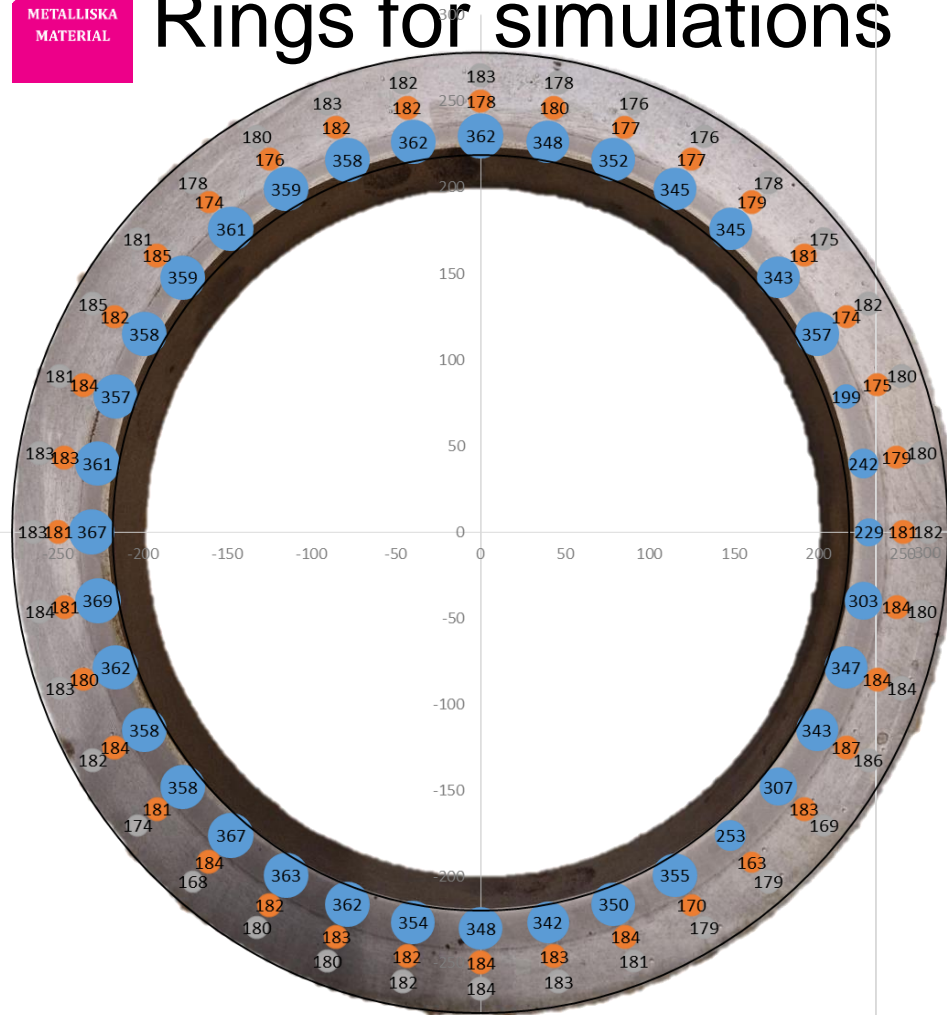

Diameter

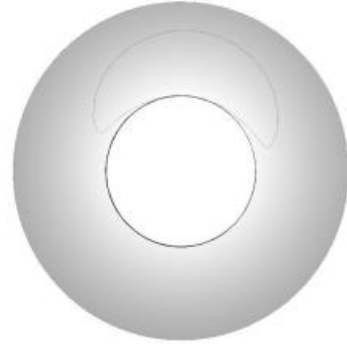

Simulation prediction

Rings for simulations

Experiments and Simulation

Summary

- Correlation between excentric centrum and out-of-roundness.
- Correlation between pos/neg and conicity.
- However, macro-seg. are very small (only 20°C Ms difference), not a likely explanation.
- The simulation tools can accurately predict the movement different material sections during ring-rolling.
