## SITEX ${ }^{\circledR}$ ST couplings

## Description

SITEX ${ }^{\circledR}$ ST couplings are fully manufactured in high quality steel They are made of 1 or 2 geared hubs which are coupled with one sleeve through which the torque is transmitted
The special OPTIGEAR profile allows very high torque transmission and the compensation of axial, angular and radial misalign-
ment (only in the version with 2 hubs). The maximum recommended working temperature is $-10^{\circ} \mathrm{C} \mathrm{a}+80^{\circ} \mathrm{C}$.
For special applications special materials should be used. Please contact our technical department for information.

1

## Features

With the special design of the OPTIGEAR crown, the contact surface area under misalignment is larger than conventional crown. Therefore, the surface stresses are reduced resulting in a longer coupling life. Therefore, backlash is reduced to a minimum, reducing impact load in reverse application, and allow optimum torque transmission and low vibration. All this results in an improved machine design.

## OPTIGEAR profile

SITEX ${ }^{\circledR}$ ST couplings are machined with the unique OPTIGEAR profile, allows backlash reduced to a minimum reducing impact load in reverse applications and allow optimum torque transmission and low vibration. The machine design is then optimized by using the most compact solution in coupling.

## Interchangeability

The range GST CF "A-B-C" conforms to AGMA specification in flange dimensions, type and positions of the screws. They are, therefore, interchangeable with any other AGMA coupling half.

## The most compact solution

Due to the exceptional torque transmission capability, SITEX $^{\circledR}$ ST couplings are the most compact solution in weight and dimensions for a safe torque transmission.

## Special executions

Special executions are available for any application need. Accurate finite element analysis can be made for special high demanding applications.

## Corrosion protection

SITEX ${ }^{\circledR}$ ST couplings are protected against corrosion with a special surface treatment. Mounting and dismounting are, therefore, guaranteed even after many years of use in difficult environment conditions.

## SITEX ${ }^{\circledR}$ ST executions

GST type C
Standard type with 2 hubs and one sleeve. Allows for axial, angular, and radial misalignment. Long hub version also available. Offers compact, powerful design, and easy assembly.

GST type CF
Flanged type made of 2 semi couplings. Flanges dimensions are according to AGMA standards (type A-B-C). They will fit any AGMA standard half.

## GST type CV

Standard type made of a single hub and one sleeve. It is also available in long hub execution. Offers an economical solution to an application without radial misalignment.

## SITEX ${ }^{\circledR}$ ST type "C"

Standard type with 2 hubs and one sleeve. Allows for axial, angular and radial misalignment. Long hub version is also
available. Offers compact, powerful design, and easy assembly. Maximum bore in the table is valid for keyway seat DIN 6885/1.

* = required space to align the coupling or replace the sealing ring
** $=$ considering hub without bore
Maximum static misalignment for a correct mounting $\Delta \mathrm{K}_{\mathrm{w}}=2 \times 1^{\circ}$
Seal flange sizes from 325 to 475

## Order form

| $T_{K N}$ | Coupling nominal torque | Nm |
| :--- | :--- | :--- |
| $\mathrm{T}_{\text {Kmax }}$ | Coupling maximum torque | Nm |
| $\mathrm{n}_{\text {max }}$ | Maximum rpm | $\mathrm{min}^{-1}$ |
| $\Delta \mathrm{~K}_{\mathrm{w}}$ | Maximum angular misalignment | $\circ$ |
| W | Weight | kg |

## Special execution with intermediate shaft

## Coupling GST FD 75 F40 L F50

GST: SITEX ${ }^{\circledR}$ ST coupling
"CF" execution type D
Size
F...: hub bore 1 end execution (mm)

L: long hub
F...: hub bore 2 end execution (mm)

## Coupling selection

1) Select the coupling according to the largest shaft diameter
2) Calculate the nominal torque $\mathrm{T}_{\mathrm{N}}$ to be transmitted:

$$
\mathrm{T}_{\mathrm{N}}=\frac{9550 \cdot \mathrm{P}}{\mathrm{n}}[\mathrm{Nm}]
$$

With $\mathrm{P}=$ nominal power installed $(\mathrm{kW}), \mathrm{n}=\mathrm{rpm}$ in the drive $(1 / \mathrm{min})$
3) Select the correct service factors $k_{1}$ and $k_{2}$
4) Verify the nominal torque of the coupling is greater than the corrected machine nominal torque:

$$
\mathrm{T}_{\mathrm{kn}} \geq \mathrm{T}_{\mathrm{N}} \cdot \mathrm{k}_{1} \cdot \mathrm{k}_{2}
$$

With $\mathrm{k}_{1}$ application service factor and $\mathrm{k}_{2}$ angular misalignment (per hub) service factor
5) Verify the machine peak or starting torque $T_{s}$ is lower than the coupling maximum torque $T_{k m a x}$
6) Verify the maximum misalignments are respected.
7) Verify the hub shaft connection could bear the transmission peak torque. If necessary change the hub shaft connection type.
8) Verify the maximum RPM of the coupling is respected.

## Application service factor $\mathbf{k}_{1}$

| Load type | Type of service | Application driven machine | Driver machine |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Electric motors or turbines | Hydraulic motors, gears drivers | Reciprocating engine Electric motors frequent starts |
| UNIFORM | Continuous duty without overloads, occasional starts up | Electrical generators <br> Centrifugal pumps and compressors <br> Light fans, escalators, belt and chain conveyors | 1 | 1,25 | 1,5 |
| LIGHT <br> peak torque | Continuous duty with light overloads and shocks for a short time and not frequent | Multistage centrifugal blowers, Steel wire machine Reciprocating pumps, Large fansAgitators (liquids) Machine tools main drive Conveyor and elevators not uniform loaded | 1,4 | 1,75 | 2 |
| MEDIUM peak torque | Intermittent duty with frequent light shocks, medium overloads (short time) | Reciprocating compressors and pumps Cranes, Agitators (solids) Hoisting equipment, Calenders for rubber or plastic Winding machine (paper industry) | 1,75 | 2 | 2,5 |
| HEAVY <br> peak torque | Duty with very high and frequent shocks, frequent load reversal | Laundry machines, Mixers for rubber and plastic Road and rail machines/equipment, Cranes ( heavy duty) Pulp grinders and refiners, paper presses Marine drives, mine fans, Wire drawing, Metal mills drives Heavy duty drives in steel mills, Hammer mills, rubber and plastic mills Stone crushers | 2 | 2,5 | 3 |

## Service factor k2 for angular misalignment

## Installation and maintenance

Good alignment of the shafts help to reduce reaction forces on shafts and bearing and is important for the coupling life.
In case the hubs are machined by the user in order to adapt them to the machine, it is user responsibility:

- to control all parameters regarding balancing, bore concentricity and any other parameter which may affect coupling life and a safe transmission, are respected.
- to verify the hub length and corresponding keyway seat are compatible with the necessary toque transmission considering the peak loads. Maximum bore diameters allowed in hubs as described in dimensional tables.
- to verify the hub material is adequate for the clamping system.

During compensation of misalignments, axial forces are generated. These forces must be considered when sizing machine bearing. For a calculation, please consult our technical office.
It is also recommended that hubs are axially secured in order to avoid axial forces on the seals which may cause lubricant leakage and, therefore, shorter coupling life.
It is recommended to secure the set screw with Loctite, use an end plate, or interference fit.

## Warning

Gear couplings are rotating parts and potentially dangerous. It is recommended to protect the rotating parts and comply with existing safety regulations in order to keep personnel and equipment safe.

## Mounting

SITEX ${ }^{\circledR}$ ST couplings must stored in a non-corrosive environment prior to installation.
In case of environment with high humidity it is the user's, responsibility to protect the couplings, or to ask for a special surface treatment.

Prior to starting the mounting operation, it is recommended to:

- verify there are no missing or damaged components
- have the necessary mounting instructions and tools required for mounting and shaft alignment.
- make sure the machine is shut down and there is no risk of accidental start up
- be careful in handling the coupling components. Particular care should be taken with the geared crown

1) Check all components to be assembled are clean.
2) Position one snap ring and one seal on every shaft.
3) Position the hubs on the respective shafts. If necessary in order to facilitate the mounting operation, it is possible to heat the hubs (max $120^{\circ} \mathrm{C}$ ). In such cases avoid contact between hub and seal until room temperature is reached.
For a safe mounting hub must be positioned flush with the shaft. Mount the set screws and tighten properly. In order to avoid accidental screws loosening due to vibration, use some Loctite glue.
4) Mount the sleeve on the longer shaft.
5) Position the units to be connected respecting the dimension "E" between the shafts.
6) Align the 2 shafts being careful that the catalogue values are respected. It is possible to use the SIT LINE-LASER to facilitate the operation.
7) Couplings are delivered without lubricant. Lightly grease the geared parts of hubs and sleeve. Lightly lubricate the seal and position them on the respective hubs.
8) Position the sleeve on the hubs. Insert the seals and the snap rings on the proper groove.
9) Remove the grease nipple and properly fill the chamber with grease. For the CF type, repeat the operation on the second half coupling. Position the grease nipple and tighten properly. Inspect and maintain.

It is recommended to make a regular inspection which may detect abnormal noise, vibration, or leakage.

Every 5.000 hours, or once a year, remove grease nipples, position the coupling with one nipple at $45^{\circ}$ with respect to the rotation axis, force grease from the bottom hole until clean grease flows. Reinsert the nipples and tighten properly.
Every 10.000 hours or every 2 years, remove snap rings and seals, clean and inspect seals and geared parts, verify alignments and mount the coupling. Low viscosity oil may be used to clean the coupling from used grease.

## Recommended lubricants

Coupling lubrication is important for a long coupling duration.

## 1. Standard speed and load

Agip GR MV/EP 1
Amoco coupling grease
API: API grease PGX-0
Caltex Coupling Grease
Castrol Impervia MDX
Chevron Polyurea grease EPO
Esso Fibrax 370
Fina Marson EPL 1
Kübler Klüberplex GE 11-680
IP: ATHESIA-EPO
Mobil Mobilux EPO, Mobilgrease XTC
Q8 Rembrandt EP0
Shell Alvania grease EP R-0 or EP 1 Albida GC
Texaco Coupling Grease
Total Specis EPG
Tribol 3020/1000-1
Unirex RS 460, Pen-0- Led EP

## 2. High speed (> $50 \mathrm{~m} / \mathrm{s}$ ), high loads

Caltex Coupling Grease
Klüber Klüberplex GE 11-680
Mobil Mobilgrease XTC
Shell Albida GC1
