Features and Benefits of FloMov™ Pump Technology

FloNergia's FloMov pumps will, not only improve water quality, but will also reduce energy costs associated with pumping/aeration systems by 50 to 70% when compared to conventional systems. Additionally, FloNergia's FloMov pumps have been proven to perform several important functions including: disrupting thermal stratification, improving oxygenation, stripping carbon dioxide and facilitating the recovery of solid waste.

Designed to handle fluids with suspended solids

- No clogging
- No special pump designs needed to pump suspended solids

Reduced noise levels

- Environment friendly
- Quiet operation

No moving parts

- No clogging
- Minimal maintenance requirements
- Reduced downtime
- Lower operating costs

Uses simple regenerative blowers/ requires a low pressure air source

- Lower operating costs
- Lower capital costs
- Minimal maintenance requirements

Simple design

- Ease of installation and replacement

Other gases can be used for injection purposes

- Lower capital costs
- Ease of operation

Ideal for high pumping volume low head applications

- Lower cost when compared to other pumping systems
- Energy savings up to 70%

Higher efficiency when compared to conventional centrifugal and axial pumping systems

- Energy savings up to 70%
- Better ROI

Uses one air source for pump operation and aeration

- One blower can provide both pump operation and aeration
- Minimal maintenance requirements
- Reduced downtime
- Lower operating costs
- Energy savings up to 70%
- Lower capital costs

Improved water aeration

- Helps maintain dissolved oxygen levels
- Lower mortality rates in aquaculture applications
- Improved growth environment for aquaculture and hydroponic applications
