1

Introduction

By order of BDA Dakadvies B.V. BDA Keuringsinstituut B.V. (NL-4202 MS/35) has determined the weather tightness of two test specimens with the **ClickFit Mounting Structure** one on a roof buildup with Lafarge, concrete 'fast cover' tiles and one on a roof buildup with OVH 206 ceramic tiles.

On 13 April 2012 the samples, ClickFit Mounting Structure and tiles, were delivered at BDA Keuringsinstituut B.V. by Esdec B.V.

On the samples the following data were found.

Description mounting structure

- * Product : ClickFit Mounting Structure
- * Producer : Esdec B.V.

Description concrete tiles

- * Product : concrete 'fast cover' tiles
- * Producer : Lafarge
- * Dimensions : 420 mm × 332 mm

Description ceramic tiles

- * Product : OVH 206 ceramic tiles
- * Producer : Lafarge
- * Dimensions : 372 mm × 268 mm

See annex B for photos of the products and further package data.

2

Investigation

The weather tightness has been determined by performing wind driven rain tests in coherence with the stipulations mentioned in:

- * CEN/TR 15601:2012 – Hygrothermal performance of buildings – Resistance to wind driven rain of roof coverings with discontinuously laid small elements – Test method.
- * Draft MCS 012:2008 – Product Certification Scheme Requirements – Pitched Roof Installation Kits.

The wind driven rain tests have been performed on three systems.

- * The first system contains the ClickFit Mounting Structure fastened with four adjustable roof hooks (four hooks for each solar module), with on top of the system one solar module. The underlying roof covering elements are concrete 'fast cover' tiles on a substructure of tile laths, the centre to centre distance of the tile laths is 335 mm, the slope of the roof is 25°.
- * The second system contains the ClickFit Mounting Structure fastened with four adjustable roof hooks (four hooks for each solar module), with on top of the system one solar module. The underlying roof covering elements are concrete 'fast cover' tiles on a substructure of tile laths, the centre to centre distance of the tile laths is 345 mm, the slope of the roof is 30°.
- * The third system contains the ClickFit Mounting Structure fastened with respectively four and six adjustable roof hooks (four and three hooks for each solar module), with on top of the system one and two solar modules. The underlying roof covering elements are OVH 206 ceramic tiles on a substructure of tile laths, the centre to centre distance of the tile laths is 313 mm, the slope of the roof is 25°.

At all these systems the solar modules have been replaced by wooden dummies.

All the other parts are the original parts as used in practice.

De dimensions of the wooden dummies are 1600 mm × 800 mm × 40 mm.

The performance of the underlying roof covering elements which are unaffected by the presence of the mounting structure has been taken as a benchmark on which the performance of the mounting structure shall be assessed. To be acceptable the mounting structure inclusive the solar modules shall have a level of performance at least equal to that of the unaffected roofing elements. A reference test has been carried out with the test roof wholly constructed with underlying roofing elements, at the same conditions.

The wind driven rain tests have been performed on the wind-rain combinations B and D. First the combination B and D have been tested on the underlying roof covering elements, subsequently the combination B has been tested on the mounting structure inclusive the solar modules (dummy). After the necessary set up of the mounting structure inclusive the solar modules has been determined, the combination D is tested on the same test specimen.

The test conditions for wind-rain combination B and D for climate zone northern Europe, costal are set at:

Combination B at a slope of 25°

- * Windspeed : 13 m.s⁻¹, after correction (slope) 9,9 m.s⁻¹
- * Rainfall : 99 mm.h⁻¹
- * Run off water : 16,5 mm.h⁻¹

Combination D at a slope of 25°

- * Windspeed : 0 m.s⁻¹
- * Rainfall : 204 mm.h⁻¹
- * Run off water : 34 mm.h⁻¹

Combination B at a slope of 30°

- * Windspeed : 13 m.s⁻¹, after correction (slope) 9,2 m.s⁻¹
- * Rainfall : 104 mm.h⁻¹
- * Run off water : 17,3 mm.h⁻¹

Combination D at a slope of 30°

- * Windspeed : 0 m.s⁻¹
- * Rainfall : 195 mm.h⁻¹
- * Run off water : 32,5 mm.h⁻¹

Order number : 0104-B-12/3 Page: 5
Date : 2013.04.26 of 11 pages

The tests have been performed in the laboratory of BDA Keuringsinstituut B.V. (NL-4202 MS/24) by Mr B. Middag of BDA Dakadvies B.V. The tests have been supervised by Mr A.R. Hameete and Mr C.W. van der Meijden MSc of BDA Keuringsinstituut B.V.

In total nine tests have been performed on the following data.

Table 1 – Performed tests

Test specimen	Wind-rain combination	Date	System
1 A	B and D	2013.02.11	unaffected roofing elements concrete 'fast cover' tiles at a slope of 25°
1 B	B	2013.02.14	roofing elements concrete 'fast cover' tiles at a slope of 25°, inclusive one dummy, tiles not grinded at the position of the adjustable roof hook
1 C	B and D	2013.02.19	roofing elements concrete 'fast cover' tiles at a slope of 25°, inclusive one dummy, two tiles (at the left side of solar panel) grinded at the position of the adjustable roof hook
2 A	B and D	2013.02.22	unaffected roofing elements concrete 'fast cover' tiles at a slope of 30°
2 B	B	2013.02.22	roofing elements concrete 'fast cover' tiles at a slope of 30°, inclusive one dummy, tiles not grinded at the position of the adjustable roof hook
2 C	B and D	2013.02.22	roofing elements concrete 'fast cover' tiles at a slope of 30°, inclusive one dummy, two tiles (at the left side of solar panel) grinded at the position of the adjustable roof hook

Table 1 – Performed tests (continuation)

Test specimen	Wind-rain combination	Date	System
3 A	B and D	2013.04.03	unaffected roofing elements OVH 206 ceramic tiles at a slope of 25°
3 B	B	2013.04.04	roofing elements OVH 206 ceramic tiles at a slope of 25°, inclusive one dummy, tiles not grinded at the position of the adjustable roof hook
3 C	B and D	2013.04.12	roofing elements OVH 206 ceramic tiles at a slope of 25°, inclusive two dummies, four tiles (two at the left side of left solar panel and two at the right side of the right solar panel) grinded at the position of the adjustable roof hook

In annex A a photo report of the test and the test results is given.

The turbulence intensity of the apparatus, the measurement of the initial pressure, the calibration of the fan system, rain generation and run-off water devices has been described in BDA-report 10-B-0939.02 dated 2013.01.29.

3

Construction of the test specimen

On respectively 6 February, 21 February and on 5 March 2013 the test specimens have been built up by Mr B. Middag and Mr R. Bikker of BDA Dakadvies B.V. under supervision of Mr A.R. Hameete of BDA Keuringsinstituut B.V.

The test specimens have been built up according to the prescription of the principal.
The following products have been used (see also table 1).

Test specimens, type 1 (concrete 'fast cover' tiles / slope of 25°)

- * Substructure : Test apparatus with a substructure of tile laths,
the centre tot centre distance of the tile laths is 335 mm
- * Tiles : Lafarge, concrete 'fast cover' tiles
- * ClickFit Montage Systeem : - adjustable roof hook
- support rail
- module clamp
- end clamp
- mounting screw
- * Solar module : 1 dummy

Test specimens, type 2 (concrete 'fast cover' tiles / slope of 30°)

- * Substructure : Test apparatus with a substructure of tile laths,
the centre tot centre distance of the tile laths is 345 mm
- * Tiles : Lafarge, concrete 'fast cover' tiles
- * ClickFit Montage Systeem : - adjustable roof hook
- support rail
- module clamp
- end clamp
- mounting screw
- * Solar module : 1 dummy

Order number : 0104-B-12/3 Page: 8
Date : 2013.04.26 of 11 pages

Test specimens, type 3 (OVH 206 ceramic tiles / slope of 25°)

- * Substructure : Test apparatus with a substructure of tile laths,
the centre tot centre distance of the tile laths is 313 mm
- * Tiles : OVH 206 ceramic tiles
- * ClickFit Montage Systeem : - adjustable roof hook
- support rail
- module clamp
- end clamp
- mounting screw
- * Solar module : 1 dummy or 2 dummies

The dimensions of the test specimens are 2,5 m × 2,0 m (length × width). The edges of the external surface of the test specimens have been sealed to the edges of the test chamber using a butyl roofing repair tape.

4

Results

Table 2 – ClickFit Mounting Structure fastened with four adjustable roof hooks (four hooks for each solar module) with one solar module in combination with concrete 'fast cover' tiles, at a slope of 25°

Test specifications		Test results [leakage in grams] <i>test specimen / wind-rain combination</i>

The ClickFit installation guide for tiled roofs

More info | www.click-fit.com

Material

A ClickFit assembly set contains the following items:

- | | |
|-------------------------------|-----------------------------|
| 1 roof hooks | 4 end clamp with screws |
| 2 mounting rail | 5 module clamps with screws |
| 3 coupling strips with screws | 6 Nylon sleeves with screws |

Tools needed

- 1 Ratchet with socket 10

The ClickFit installation guide for tiled roofs

More Info | www.click-fit.com

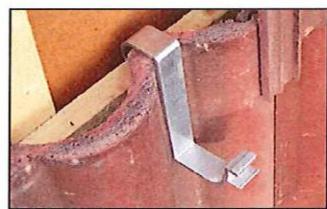

1. Preassembly of the nylon sleeves

Use the holes in the frame of the solar module to fix the nylon sleeves. Use the M6 nut and bolt to fixate the sleeves onto the solar panel at the same side as the connection box. The solar panel is temporarily mounted on the rail with the nylon sleeves. (see point 5.)

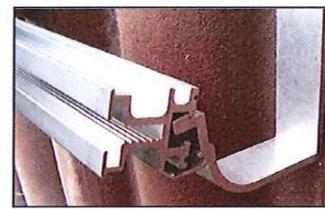

2. Preassembly of coupling strips

When combining multiple rails you have to use the coupling strips to extend the mounting rails. You simply slide the coupling strip in the side of the mounting rail and fixate it with the short mounting screws.

3. Placing the roof hooks

Divide the roof hooks evenly over the mounting rails. It is advised to place an extra roof hook in edge or corner zones. The roof hooks are placed over the battens and the roof tiles. Most of the times the roof tiles easily slide upwards underneath the upper laying roof tile. This gives you enough space to fixate the roof hook onto the batten in the lower part of the roof tile. This will fit in most of the times. In some occasions the roof tile needs to be grinded down a bit to make a snug fit. When the roof hooks are fixated slide the roof tile back into place. The next step is to determine where the next mounting rail will be mounted and place the roof hooks accordingly. The mounting rails are placed at $\frac{1}{4}$ from the bottom and top of the solar module.

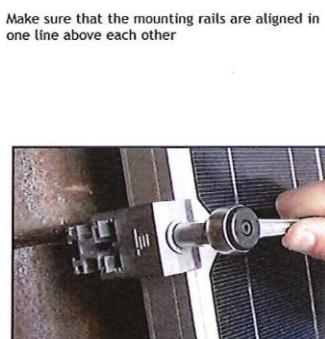

4. Fixating the mounting rails

Hang the rails on the roof hooks. Click the mounting rail onto the roof hooks. Make sure that it Click is made firmly. It can be handy to use the mounting wedge which is placed between the roof hooks and the roof tile. This makes it easier to Click.

5. Hang the solar module on the rail

Temporarily hang the solar module on the rail with the nylon sleeves. As a result you have both hands free when mounting the solar modules.

6. Mounting the first panel on the mounting rails

You can now fixate the first module. Hang the module on to the mounting rail on the preassembled nylon sleeves. Slide the solar module to the side towards the end of the mounting rail. Slide the end clamp onto the mounting rail. Make sure you choose the right slot for the particular solar module frame height. Now fixate the solar module with the long mounting screws.

7. Mounting the other solar panels

Hang the second solar panel on the rail and slide it towards the first until a gap remains of about 7mm. Now fix the panel with the long screw and the module clamps. Make sure that the solar panels are aligned before tightening the screws. Repeat this with the remaining solar panels. For the mounting of the last solar panel see 6.

8. Mounting more rows of solar modules underneath each other

To get one solid surface of solar panels when there are multiple rows, you can slide the solar panels up after you hanged them on the sleeves against the upper row of solar panels. Now fixate the solar modules on the rails with the long mounting screws and the brackets.

The ClickFit mounting structure for tiled roofs

Das ClickFit Montagesystem für Ziegeldach
Het ClickFit montagesysteem voor pannendak

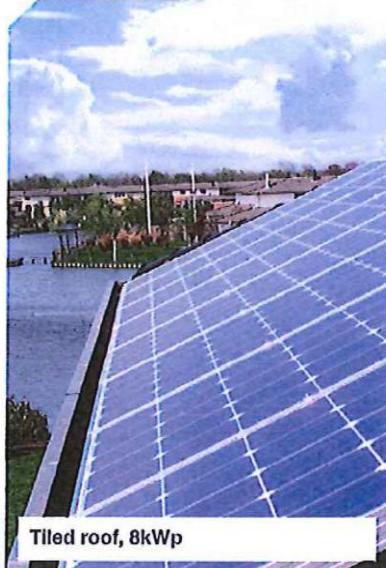

ClickFit for tiled roofs:
The mounting structure is composed out of the patented roof hooks, mounting rail and small components to mount the solar modules on to the mounting rail. The system can be used for every type of tiled roof irrespective of the type of roof tile.

Roof connection:
The roof hooks are fixed on the battens. The location of the modules on the roof can be chosen freely because the roof hooks are not fixed on the rafters or trusses. Height variations in the roof can easily be levelled with use of the height adjustment piece or the adjustable roof hook.

Mounting of the rail:
The rail is fixed on the roof hooks trough a click joint. No further tools or hardware are needed.

Mounting of the solar modules:
Nylon sleeves which are fixed on the solar module make the installation of the solar modules on the rail easy. The modules are being fixed on the mounting rail with the use of universal module clamps, end clamps and mounting screws. The mounting screws are screwed directly into a special formed thread in the mounting rail.

Needed tools:
Ratchet 10mm

ClickFit für Ziegeldach:
Das System ist aufgebaut aus patentierten Dachhaken und Schienen und die benötigte Kleinteile um die Module zu montieren. Das ClickFit Montagesystem für Ziegeldach kann für alle Ziegeldächer benutzt werden unabhängig der Ziegelart

Dachmontage:
Die Dachhaken werden an die Lattung befestigt. Dadurch dass die Dachhaken nicht an die Sparren montiert werden ist man frei die Platz von den Solarmodulen zu wählen. Höhenausgleich ist einfach durch ein spezielles Höhenausgleichsteil oder durch die verstellbaren Dachhaken

Befestigung von der Schiene:
Der Schiene wird an die Dachhaken befestigt durch einen Klick Verbindung. Hierzu braucht man keine Werkzeuge oder Kleinteile

Kreuzschienensystem:
Das ClickFit System kann auch als Kreuzschienensystem benutzt werden für zum Beispiel waagrechte Montage von den Modulen. Man benutzt ein Kreuzverbinder für die Verbindung von die Schienen

Benötigte Werkzeuge:
Ratsche 10mm

ClickFit voor pannendak:
Het montagesysteem is opgebouwd uit de gepatenteerde dakhaken, montagerails en de benodigde montagematerialen om de zonnepanelen op de montagerail te monteren. Het ClickFit montagesysteem voor pannendak kan voor alle type pannendaken worden gebruikt ongeacht het type dakpan.

Dakbevestiging:
De dakhaken worden aan de panlatten bevestigd. Doordat de dakhaken niet worden bevestigd aan de daksporen of dakspannen kan men de plaats van de zonnepanelen op het dak vrijelijk bepalen. Hoogte verschillen in het dak kunnen eenvoudig worden uitgevuld doormiddel van een speciaal opklip blokje of door gebruik van de verstelbare dakhaken.

Bevestiging van de montagerail:
De montagerail wordt aan de dakhaken bevestigd middels een klikverbinding. Hiervoor zijn geen verdere materialen of gereedschappen nodig.

Bevestiging van de panelen:
De handige montagehulp draagt bij aan de snelle en veilige montage en dient tevens als afslid beveiliging. De zonnepanelen worden vastgezet door middel van een universele paneelklem, eindklemmen en montage schroeven. De montage schroeven worden direct in de montagerail geschroefd waarin een speciale Schroefdraad is aangebracht.

Benodigde gereedschappen:
Ratel 10mm.
