

# XSENS AS - Sustainable Business Development

**Xsens AS owners and company management are committed to high compliance standards for Xsens world-wide measurement business and its business operations.** Xsens management frequently report to the Board of Directors the general status and KPI achievements for sustainable business development of HSE, Finance and ESG including focus on anti-bribery activities and compliance to UN sustainable development goals:

**Xsens AS clamp-on technology** reduces the risk of **leakage of gases to air** and **discharge to sea**, by a significant reduction of potential leakage points compared to traditional in-line flow meter systems. Also, compared to in-line flow meters, the installation of Xsens clamp-on flow meters require no or very limited change in pipe-line configuration, hence a **reduction of climate gases** resulting from reduced fabrication of piping, piping details and coating. Finally, Xsens AS continuously seek update of flow meter design to minimize the climate foot-print of manufacturing activities for production of the flow meter itself.

**Xsens AS actively seek new sustainable applications** where clamp-on flow meters have the potential of infrastructure cost reduction, such as applications for **water**, as well as pollution monitoring of **gases to air** and **discharge to sea**.
